

Pivoting to an **intelligent** supply chain

From latent to responsive

Currently, enterprises suffer from latency in their production processes. Tomorrow's competitive advantage will be based on the speed of information flow and ability to use AI to intelligently predict and simulate scenarios, and ultimately become negatively latent. This is made possible by shifting from manual and paper-based processes to AI-augmented decision-making by humans.

Past

Latency-laden value chain

- Supplier network
- Manufacturing network
- Last-mile network

Future

Responsive and dynamic networks and demand webs, connected by a single cloud platform, streamlining data collection and the surfacing of insights
