

The future of supply chain: taking a new approach

Future supply chains will be intelligent, enabled by a core cloud-based central platform that will integrate, orchestrate, and execute actions by working with each variable of the value chain. This creates a more holistic view of operations for enterprises, providing for new levels of agility, responsiveness, and risk mitigation.

PAST

Push-based, reactive supply chain

Produce, stock and dispose of excess, with no visibility into customer expectations

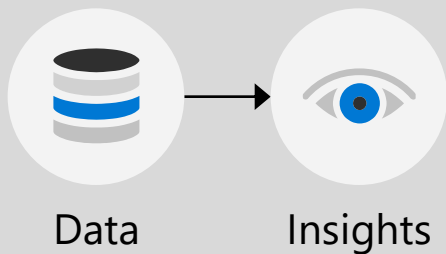

Data stranded across the enterprise

CURRENT

Semiautonomous supply chain

Partial automation allows organizations to selectively digitize (e.g., sensors on pallets)

FUTURE

Intelligent and autonomous supply chain

The supply-chain ecosystem is able to sense, predict demand peaks and shape outcomes.
