Common data
platform

In just one year, the number of companies choosing a cloud ERP deployment more than tripled, compared to a 78% drop for on-premises ERP solutions. For more than a decade, **Microsoft** has been an agent for that change.

Cloud versus on-premises deployments¹

“

If we didn't go to the cloud-based, mobile-based (platform), it would become a huge limiting factor to our growth and maybe even our existence in the future.²

Carl Spackman

*VP, Finance,
Copper State Bolt & Nut Co.*

Companies relying on a modern ERP platform are more likely to:

Achieve complete and on-time deliveries

Receive timely data for decisions

Meet internal schedules

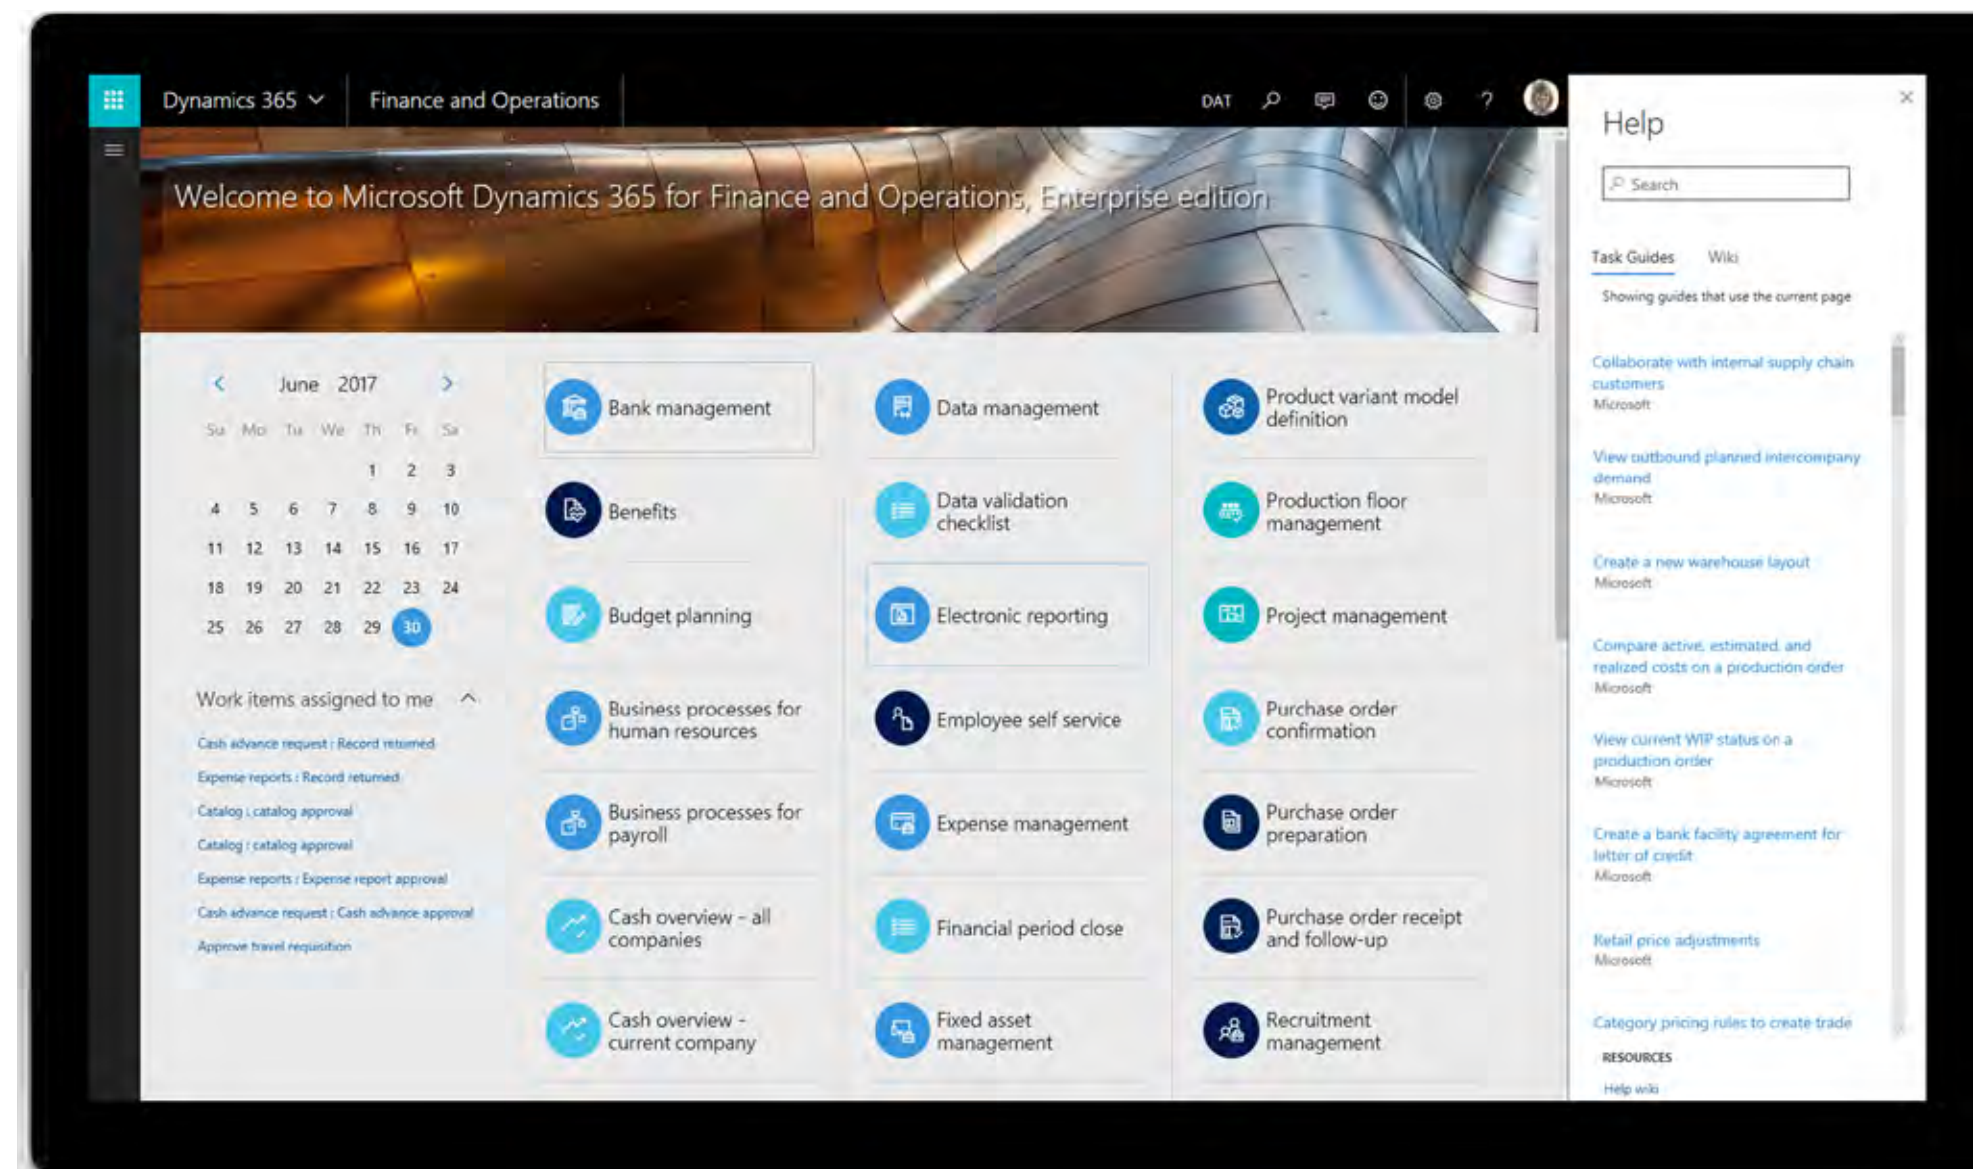

See improvements in profitability

Maintain accurate inventory

But more than half of ERP-using companies still rely on an outdated platform. **That's costly.**

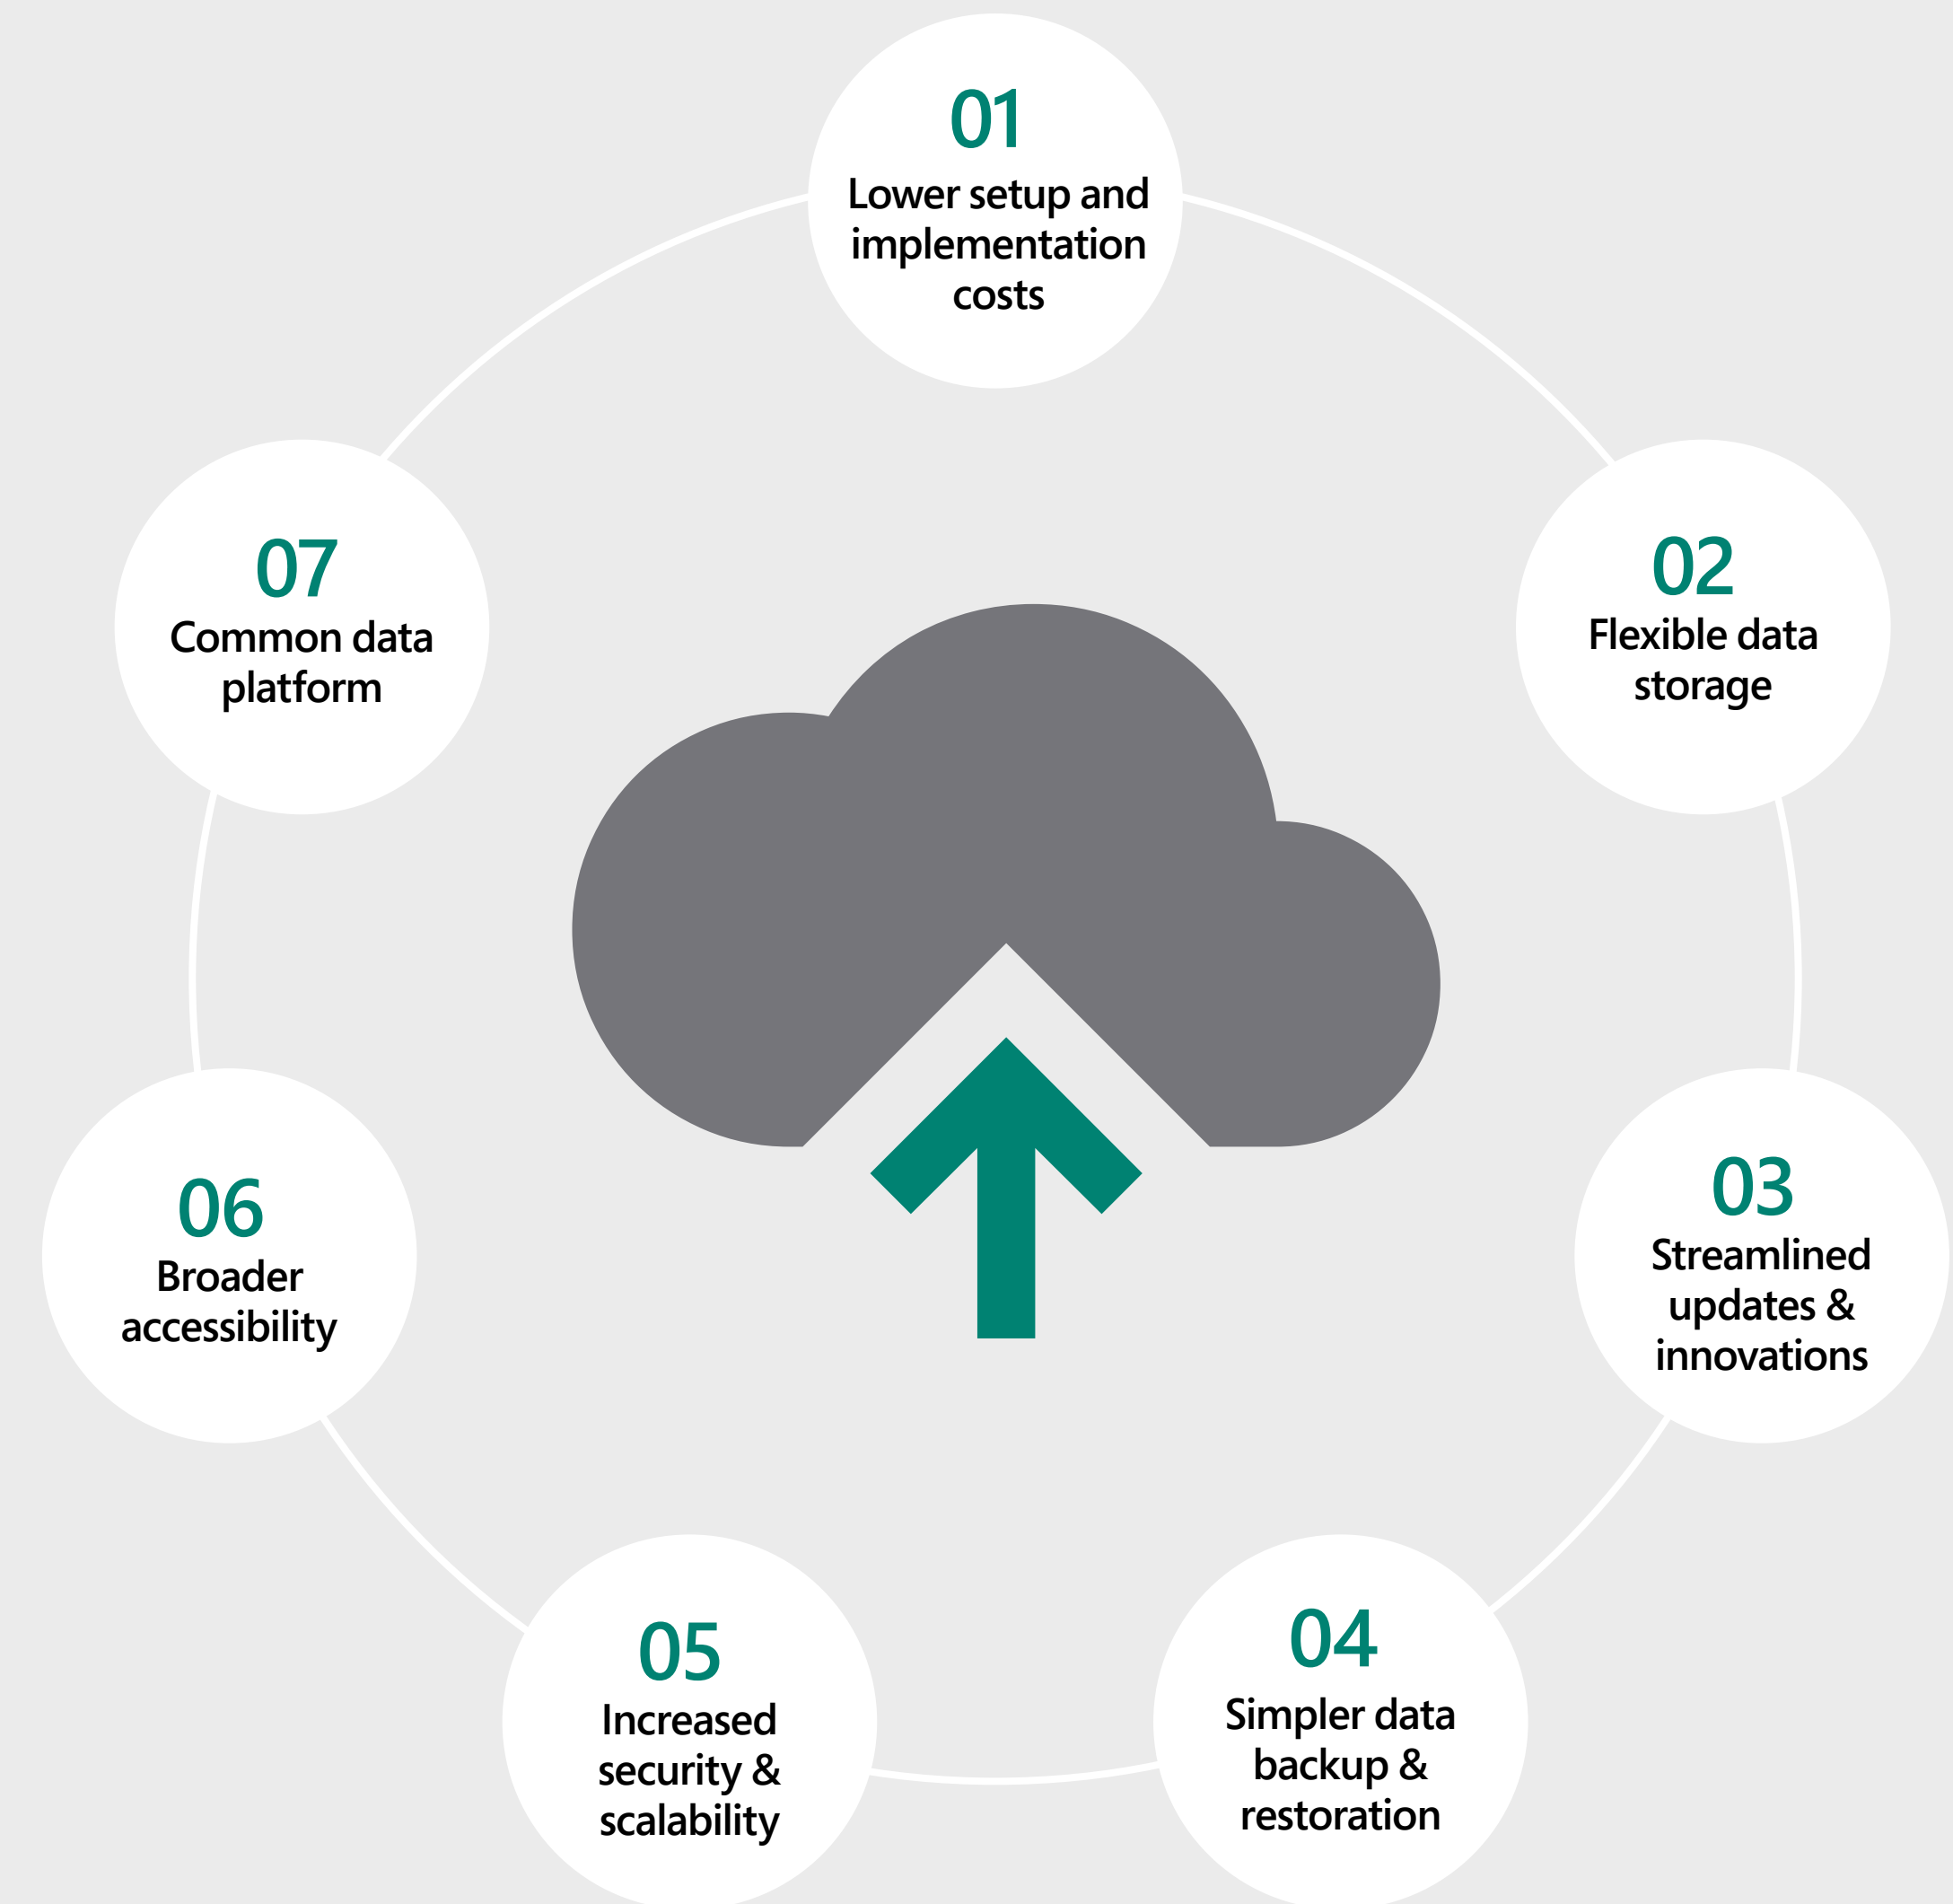

The data is clear: companies running up-to-date solutions have a competitive edge.³

Businesses using on-premises solutions are stuck battling yesterday's problems.

But when you upgrade your company's ERP to the cloud, you're setting up your business for future success.

Here's how Microsoft's cloud-based Dynamics 365 platform is defining tomorrow's opportunities.

01 /

Lower setup and implementation costs

January
2019

Lower setup and implementation costs

7

On-premises

Deployment usually requires a significant hardware and personnel investment.

Cloud-based

Off-site hosting and provider expertise eliminate the need for additional hardware or personnel.

A reduced **total cost of ownership** is the **#1 reason** why companies switch to a cloud-based ERP.⁴

02 / Flexible data storage

On-premises

Additional hardware needs to be purchased when on-site servers are at capacity.

Cloud-based

Companies can quickly scale storage up or down as needed.

”

Microsoft has taken most of the load off of our department—all the things that are a cost to an IT organization. Now we can focus on things that really add value to the business.

Norman Whitelaw

VP, IT,
GSE Environmental

03 /

Streamlined updates & innovations

On-premises

On-site updates are a time-consuming process requiring skilled personnel.

Cloud-based

Upgrades are pushed out from the provider and approved on-site to protect customizations.

Companies running an up-to-date ERP system are **50% more likely** to have business analytics and intelligence.⁵

04 /

Simpler data backup & restoration

On-premises

Complex data backup process usually requires a maintenance plan in a SQL server, plus other products/services.

Cloud-based

Regular system backup is taken daily and is available to users, with a provision to create user backups.

Nearly **1/3 of companies** switching to a cloud ERP are doing so to **reduce their dependence on internal IT teams**.⁶

05 /

Increased security & scalability

On-premises

Environments are usually less secure, requiring costly additional monitoring and a dedicated IT admin.

Cloud-based

Microsoft-owned and managed data centers are secure, certified, and compliant with international standards.

The ability to safeguard internal information is one of the **top 5 reasons** companies switch to a cloud-based ERP.⁷

06 /

Broader accessibility

On-premises

Accessing an on-premises deployment remotely is complicated by the Active Directory authentication process.

Cloud-based

Separate authentication means Dynamics 365 can be accessed remotely and across device types.

More than **25% of companies** switching to cloud ERPs are looking to **improve their agility and functionality.**⁸

07 /

Common data platform

On-premises

On-premises solutions are more difficult to integrate with other applications.

Cloud-based

Dynamics 365 Common Data Service helps to create both new data models and apps with connected data.

Half of all companies switching ERP providers say their previous platform was **too limited in functionality**.⁹

On-premises

1. Deployment usually requires a hardware and personnel investment.
2. Data storage capabilities depend on capacity of on-site servers.
3. On-site updates require skilled personnel and an involved deployment process.
4. Data can be backed up with a SQL server maintenance plan, plus other products/services.
5. Additional monitoring costs and a dedicated IT admin suggested for a less secure environment.
6. Authentication for on-premises platform usually requires local access.
7. On-premises solutions can be integrated with other apps through intensive customizations.

The payoff of moving to the cloud: **A platform that's more reliable, accurate, profitable.**¹⁰

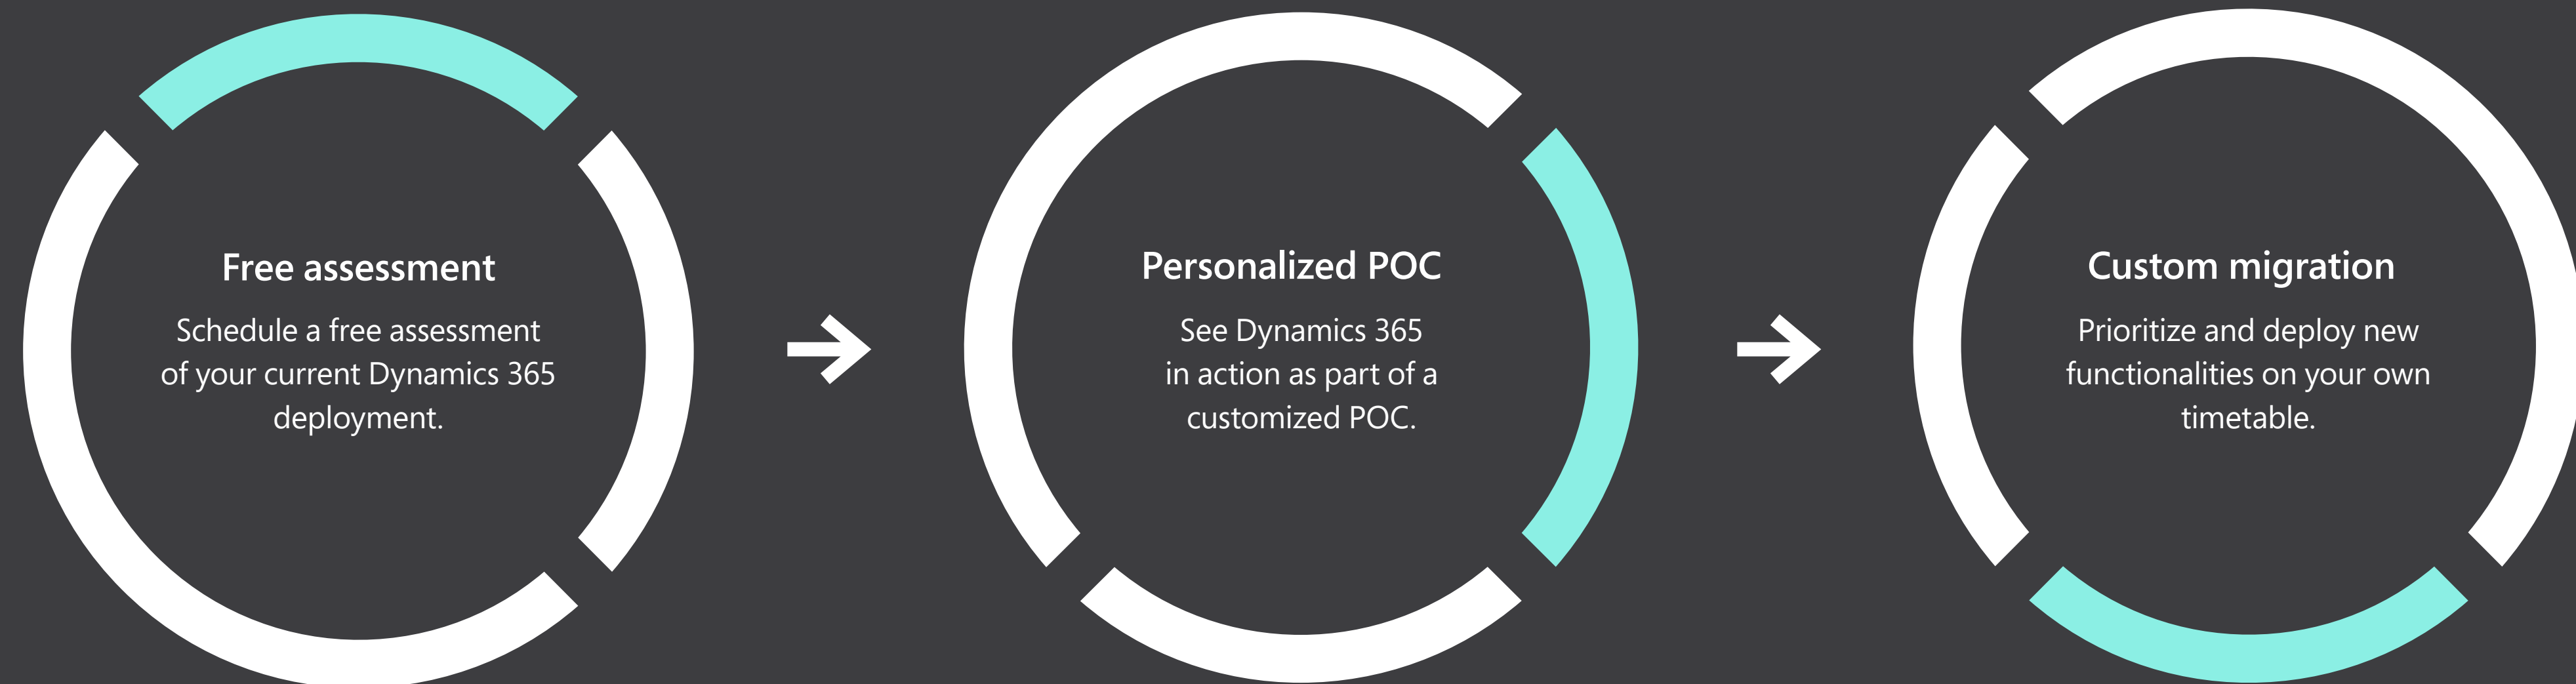

Cloud-based

1. Off-site hosting implementation can be completed in just days or hours.
2. Companies can quickly scale storage up or down as needed.
3. Upgrades are pushed out from the provider and approved on-site to protect customizations.
4. Regular system backup is taken daily and is available to users, with a provision to create user backups.
5. Microsoft-owned and managed data centers are secure, certified, and compliant with international standards.
6. Separate authentication means Dynamics 365 can be accessed remotely and across device types.
7. Dynamics 365 Common Data Service helps to create both new data models and apps with connected data.

The advantages are obvious. The process is easy.

Microsoft also offers the quality partnership you need to make migration to the cloud possible.¹¹

When you look at it in terms of the efficiencies around improving how quickly people can do things, how easily people can do things ... that's where Dynamics 365 for Finance and Operations had the biggest impact.¹²
